*Liriomyza* spp. are leafminer pests associated with imported fresh produce, plants and other commodities. Rapid and precise identification of juvenile individuals of *Liriomyza* spp. is of crucial importance to enable appropriate biosecurity decisions to be made at the border or post-border. We have developed a multiplex TaqMan real-time PCR assay that can simultaneously detect *Liriomyza huidobrensis*, *L. sativae* and *L. trifolii* in a single test. Species-specific primers and probes were designed against existing genomic sequences within the mitochondrial cytochrome oxidase I gene. The real-time assay was specific for *L. trifolii*, *L. huidobrensis* or *L. sativae*, both in simplex and multiplex formats. Serial dilution results showed reliable amplification at a  $10^{-4}$  dilution (1 pg of DNA) and generally even at  $10^{-5}$  dilutions (0.1 pg), which allows the possibility of using only a small amount of tissue for DNA extraction.
